                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             480
                                                                                                                                               The present protein sequence is the interferon regulatory factor-7 (FRF-7). 2D protein, that is modified in the transactivation domain. The serine and threonine residues in the carboxy terminus are modified post-translationally, by phosphorylation, following sendai virus infection. The modified IRF-7, substituted with aspartic acid, functions as a activator of promoters containing ISRs regulatory elements and stimulation of DNA binding and transcriptional activity. IRF-7 protein the treatment of viral infections like, influenca, herpes or HIV infection. They may also be used to activate a cytokine gene, in cancer treatment or to modify a target cell of an organism.

The KWC02, an interferon response factor (IRF) homologue, is a transcription factor. The polynuclectides encoding intracellular regulatory molecules are useful for regulating cell division and proliferation of various cell types, including tumour cells. Specifically, they are also useful for treating cancer, infections, wounds, developmental abnormalities or metabolic problems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 MALAPERAAPRVLFGEWLLGEISSGCYEGLQWLDEARTCFRVPWKHFARKDLSEADARIF

(5D) protein. The serine and threonine residues are post-translationally modified by phosphorylation, following sendia virus infection. The modified by phosphorylation, following sendia virus infection. The modified IRP, substituted with aspartic acid, functions as a strong activator of promoters containing ISRE and PRDI/PRDII regulatory elements, stimulation of DNA binding and transcriptional activity and proceasome mediated degradation. The modified IRF sequences are used for the treatment of viral infections like, influenza, herpes or HIV infection. They may also be used to activate a cytokine gene, in cancer treatment or to modify a target cell of an organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel polynucleotide (I) encoding human ADA2. The products of the invention have cytostatic activity and can be used for gene therapy. (I) is useful for treating cancer; as primers and probes for isolating full length cDNA and genes having similar biological activity. This sequence represents the human IRF3 protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polynucleotide encoding human AD2 is useful for treating cancer and isolating cDNAs and genes having similar biological activity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAW78323-AAW80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPPSSRGGGPPPEAETAERAGWKTNFRCALRSTRRFVMLRDNSGDPADPHKVYALSRELC 129

                                                                                                                                                                                              The present protein sequence is the interferon regulatory factor-3 (IRF-3)5D protein, that is modified in the transactivation domain. The serine and threonine residues in the carboxy terminus are modified post-translationally, by phosphorylation, following sendai virus infection. The modified IRF-3 substituted with aspartic acid, functions as a strong activator of promoters containing PRDI/PRDII or ISRE regulatory elements, etimulation of DNA binding and transcriptional activity, association of IRF-3 with the transcriptional co-activator CBP/p300 and proteasome mediated degradation. The modified IRF proteins are used for the treatment of viral infections like, influenza, herpes or HIV infection. They may also be used to activate a cytokine gene, in cancer treatment or to modify a target cell of an organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      63

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel murine lymphocyte-specific interferon regulatory factor [LSIRF or ISF-3] (AAR99426) binds to interferon-stimulated response elements in DNA. Its amino acid sequence was deduced from a CDNA clone (AAT41701) isolated from a mouse spleen cDNA library. Recombinant LSIRF can be produced in transformed prokaryotic or eukaryotic host cells. LSIRF polypeptides are useful as targets for therapeutic cpds. used to regulate lymphocyte activation. By blocking LSIRF activity it is possible to suppress lymphocyte activation in response to certain environmental stimuli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Lymphocyte specific interferon regulatory factor; LSIRF; IRF-3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens to polynucleotides, antibodies against human ovarian antigens, and the use of ovarian antigens polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders (e.g., infertility, disorders of pregnancy, anovulation, polyndrome, ovarian or press of pregnancy, anovulation, polystic ovary syndrome, ovarian cysts, and dysmenorrhoes), endocrine disorders, infertions (e.g., chamadial and acquired to disorders, infertions (e.g., chamadial and acquired vapinties), immune disorders (e.g., congenital and acquired immunodeficiencies, autoimmune oophoritis, systemic lupus erythematosus), blood-related disorders (e.g., anaemia), cardiovascular disorders, capinal disorders, and urinary system disorders of solvarian antigen systemic disorders of mol urinary system disorders. Ovarian respiratory doubless and polynucleotides may also be used in screening for compounds which further he used for game therapy, chromosome manning in the polynucleotides may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                further be used for gene therapy, chromosome mapping, in the identification of individuals and in forensic analysis, and the polypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human overtian antigen of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score 446; DB 23; Length 175;

The amino acid sequence of the Sigle Q form was deduced from a CDNA clone (AAT41706) isolated from a human lymphocyte CNNA library. Recombinant LSIRF can be produced in transformed prokaryotic or eukaryotic host cells. LSIRF polypeptides are useful as targets for therapeutic cyds. used to regulate lymphocyte activation. By blocking LSIRF activity it is possible to suppress lymphocyte activitation in response to certain environmental stimuli.

(UYCO ) UNIV COLUMBIA NEW YORK 97WO-US09065. 96US-0654482. Dalla-Favera R; 28-MAY-1997; 28-MAY-1996;

WPI; 1998-032309/03. N-PSDB; AAV04017 Determining predisposition to multiple myeloma - allows identification of MUM-1 and MUM-2 genes, and determines specific chromosome 14 lesion

Claim 29; Fig 5B; 143pp; English

This protein is encoded by a candidate human proto-oncogene, MUM-1 (multiple myeloma oncogene 1) (see AAV04017). Juxaaposition of the MUM-1 gene to the IgH gene as a result of t(6;14) (p25;932) translocation is recurrent in multiple myeloma (MM). The invention provides: a method of determining a chromosomal breakpoint in a subject suffering from MM, a method of identifying a gene located in chromosome 14 that is altered by a chromosomal breakpoint detected in a subject suffering from MM; a nucleic acid probe; a method for detecting a predisposition to MM, a nucleic acid probe; a method for capable of hybridising to m RNM or CDNA encoding a MUM protein; and a pharmaceutical composition comprising an oligonucleotide effective in preventing overexpression of a MUM protein. Analysis of 144-chromosomal translocations and identification of genes altered in MW will allow: (1) the determination of chromosomal sequences lesion 144+ translocations, the most important cytogenetic lesion associated with MM pathogenesis elucidation; (2) elucidation of specific gene lesions for MM; (3) a diagnostic method based on counteracting the action of abnormal gene products.

193 ADHLLTASWGADPVPTKAPGEGOEGLPLT-----GACAGGPGLPAGELYGWAVET

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA0825-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of identifying compounds which bind to polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention have homology to known proteins, thereby polypeptides of the invention have homology to known proteins, thereby polypeptides of the invention have homology to known proteins, thereby polypeptides of the invention have homology to known proteins, thereby polymential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activity; inmunomodulatory activity; tissue growth activity; immunomodulatory activity; tissue growth activity; chemotactic or chemokinetic activities; haemostatic, thrombotic or thrombolytic activities; receptor or limbin-related activities; chemotactic or chemokinetic activities; no may be involved in oncogenesis, cancer cell proliferation or metastasis.

Depending on their biological activities, polypeptides and nucleotides of

```
that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug
   invention are useful for preventing, treating or ameliorating medical
                   conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthmia or arthritis), proliferative retinopathy, atherosclerosis; coronary heart disease, arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal vascular growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound healing (e.g., of burns, incisions and ulcers), while those with immunomodulatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders. Polypeptides with factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         screening techniques. The present sequence represents a novel human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polypeptide of the invention.

oteins and DNA encoding sequences useful for preventing, or ameliorating a medical condition in a mammalian subject e.g. arthritis and cancer -Human proteins treating or ame

Claim 20; Page 287-288; 1963pp; English

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a comprise and as relates to vectors and recombinant host cells comprising a comprise the invention. Although novel polypeptides, and the invention and sethods of detecting the nucleotides or polypeptides of the invention. Although novel, many of the bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention. The polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence conferenced in the sequence activities, and hence differentiation activities, including cytokine, cell proliferation or cell differentiation activities, including cytokine, cell proliferation or cell conferenced or conferenced activities; the membropolytic activities; seem cell growth activity; issue growth activity; involved in oncogenesis, receptor or ligand activities, or may be conferenced on the invention are useful for preventing, treating or metastasis.

Conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include arterial isonemia, bone disorders (e.g., method or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), corditions, e.g., by protein or gene therapy. Such conditions include retrial isonemia, bone disorders (e.g., method or lymphoid cell disorders) carde encoding them) may be used to promote wound repair (or nucleic acide encoding them) may be used to promote cells includes may be used in cellmunomedulatory activities may be used in the treatment of viral, chart can be used to augment or remained the conditions includes and publications in adjutton to immune disorders (e.g., promote cells in culture to give rise to neurosphinal activity may be used in cell and burged to augment or seman that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides any also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human polypeptide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to erytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, nematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or

```

```
This sequence represents a secreted human protein encoded by the nucleic acid molecule designated Gene 54 from the human cDNA clone HPRCU93

Cdeposited as clone ATCC 97899 and ATCC 209045).

The gene can be used to generate fusion proteins by linking to the gene con be used to generate fusion proteins by linking to the gene con a human immunoglobulin Fc portion (e.g. AAV59502) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 186 novel genes and their fragments (nucleic acid sequences: AAV59511-V59812, amino acid sequences AAW4731-W75026)

Which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polynucleotides in a sample or by determining the presence of mutations in the new polynucleotides. Described uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in (see AAV59511 for described uses).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated human genes and the secreted polypeptide(s) they encode - useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders
                                                                                                                                                                                                                                                                                                                                                                                                                 DP, Brewer LA, Carter KC, Duan R, Ebner R, Endress GA; Ferrie AM, Fischer CL, Florence KA, Greene JM, Hu JS; Lafleur DW, Li Y, Moore PA, Ni J, Olsen HS, Rosen CA; Shi Y, Soppet DR, Young PE, Yu GL, Zeng Z;

Human, S' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a polypeptide encoded by one of a large number of 5. ESTs derived from mRNAs encoding secreted proteins. The 5. ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3. untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5. ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5. UTR is rarely included. 5. ESTs are derived from mRNAs with intact 5. ends and can therefore be used to obtain full length cDNAs and genomic DNARs. 5. ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 136;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Description

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Hiscott J, Lin R;

WPI; 1999-620201/53. N-PSDB; AAX90993 Carboxy-terminus modified highly active forms of interferon regulatory factor proteins used for the treatment of viral infections.

Claim 14; Fig 12; 93pp; English.

The present protein sequence is the interferon regulatory factor-7 (IRF-  $^{7}$ ) 2D protein, that is modified in the transactivation domain. The serine

                                                                                                                                                                                                                                                                                                       9
and threonine residues in the carboxy terminus are modified post-
translationally, by phosphorylation, following sendai virus infection. The modified IRF-7, substituted with aspartic acid, functions as a
activator of promoters containing ISRE regulatory elements and
stimulation of DNA binding and transcriptional activity. IRF-7 protein
shows highest homology to IRF-3. The modified IRF proteins are used for
the treatment of viral infections like, influenza, herpes or HIV
infection. They may also be used to activate a cytokine gene, in cancer
treatment or to modify a target cell of an organism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             QRRGSPRYTIYLGFGQDLSAGRPKEKSLVLVKLBPWLCRVHLBGTQREGVSSLDSSDLDL

The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises or chronic obstructive pulmonary disease. The method comprises or chronic obstructive pulmonary disease. The marker gene in a biological sample from a subject, comparing the expression level of the marker gene in a biological sample from a healthy subject, and judging whether the subject has bronchial asthma or chronic obstructive pulmonary disease. The marker gene comprises: (a) a group of genes (31) whose expression levels increase when respiratory epithelial cells are stimulated with interleukin-13, Also described: (l) a group of genes (32) whose expression levels decrease when respiratory epithelial cells are stimulated with interleukin-13. Also described: (l) a reagent (l) for testing for bronchial asthma or chronic obstructive pulmonary disease; (2) a kit for screening for a candidate compound for a therapeutic agent to treat bronchial asthma or chronic obstructive pulmonary disease; (3) an animal model for bronchial asthma or chronic obstructive pulmonary disease; (4) an inducer that induces bronchial asthma or chronic obstructive pulmonary disease, (6) a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease, comprising the compound, a marker gene or an antiense nucleic acid corresponding to a portion of the marker gene or an antiense nucleic acid corresponding to a portion of the marker gene, and fol an DNA chip for testing for expression of the gene through an RNAi effect or an antibody recognising a probe has been immobilised to assay a marker gene. (1) has respiratory and antiasthmatic activities, and can be used in gene therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease. The present is useful for testing for or screening for a therapeutic agent in the exemplification of the present invention.
                                                                                                                                                                                                                                                                         Testing for bronchial asthma or chronic obstructive pulmonary disease by comparing the expression level of a marker gene in a biological sample from a subject with the expression level of the gene in a sample from a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 or chronic obstructive pulmonary disease. The method comprises determining the expression level of a marker gene in a biological sample from a subject, comparing the expression level determined with the expression level of the marker gene in a biological sample from a healthy subject, and judging whether the subject has bronchial asthma or chronic obstructive pulmonary disease. The marker gene comprises: (a) a group of genes (S1) whose expression levels increase when respiratory epithelial cells are stimulated with interleukin-13, or (b) a group of genes (S2) whose expression levels increase when respiratory epithelial cells are stimulated with interleukin-13, or (b) a group of genes (S2) whose expression levels decrease when respiratory epithelial cells are trimulated with interleukin-13. Also described: (1) a reagent (1) for testing for bronchial asthma or chronic obstructive pulmonary disease; (2) a kit for screening for a candidate compound for a therapeutic agent to treat bronchial asthma or chronic obstructive pulmonary disease; (3) an animal model for bronchial asthma in a mouse; (5) a method for producing an animal model for bronchial asthma in a mouse; (5) a method for producing an animal model for bronchial asthma or chronic

obstructive pulmonary disease; (6) a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease, comprising the compound, the marker gene or an antisense nucleic acid corresponding to a portion of the marker gene, a ribozyme, a polynucleotide that suppresses the expression of the gene through an RNAi effect or an antibody recognising a protein encoded by a marker gene; and (7) a DNA chip for testing for bronchial asthma or a chronic obstructive pulmonary disease, on which a probe has been immobilised to assay a marker gene. (1) has respiratory and antiaethmatic activities, and can be used in gene therapy. The method is useful for testing for or screening for a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       VYALSRELCWREGPGTDOTEAEAPAAVPPPOGGPPGPFLAHTHAGLQAPGPLPAPAGDKG 180

                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polyneptides or their antibodies. The polynucleotide or the compound that method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that medulates its activity is useful for preparing a medicament for treating pain and spared nerve injury (SNI) in an animal (e.g. gene herapy). The sequence presented is a human protein (shown in Table 2 of the sequence data for this patent did not form part of the printed the sequence as obtained in electronic form directly from WIPO at the print of the interval of the printed the contract of the printed the contract of the contract 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            VYALSRELCWREGPGTDQTEAEAPAAVPPPQGGPPGPFLAHTHAGLQAPGPLPAPAGDEG 180

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also comprising the novel polynucleotide, a host collomptising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the contribition and compound that regulates the activity of one or more of the contribition.
                                                                                                                                   420

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 27-FEB-2003
```

```
activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic construction injury (CCI) and spared nerve injury (SNII)) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at fip.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          420
